

Summarized kg CO<sub>2</sub>e per calculated object

Kg CO<sub>2</sub>e per layer

## Bidcon Climate Module

Calculating the environmental impact on buildings can be easy

The Bidcon climate module allows fast and effective climate and cost estimations. Bidcon users are able to automatically generate entire climate estimate reports for buildings without any additional work.

The new functionality is a result of the combination of Bidcon's climate estimate functionality and a climate database created by Tyréns, Sweden's largest construction and environmental consultancy.

As a Bidcon user you do not have to connect each material used with the right emissions factor in order to get a value for both cost and climate impact, as it will be automatically calculated. You can simply input alternative solutions and quickly get comparable values for both cost- and climate data.

Benefits with Bidcon climate module

- The actual quantities of the building form the basis for the climate calculation, while other software in the market today often works with key figures.
- Bidcon's calculation engine makes it possible to show the climate impact from more dimensions compared to traditional LCA tools. (Code structures, locations, cost, time, etc.).
- By comparing the climate impact value side by side to cost and time, you get relevant information to make your choice of materials in a building.
